# Total Maximum Daily Load Information Sheet

## Edina Lake

---

### Waterbody Segment at a Glance:

**County:** Knox  
**Nearby Cities:** Edina  
**Area of impairment:** 51 Acres  
**Pollutant:** Atrazine, Cyanazine  
**Source:** Corn, Sorghum  
Production

State map showing location of watershed

**TMDL Priority Ranking:** High

---

### Description of the Problem

#### Beneficial uses of Edina Lake:

- Livestock and Wildlife Watering
- Protection of Warm Water Aquatic Life
- Protection of Human Health associated with Fish Consumption
- Boating and Canoeing
- Drinking Water Supply

#### Use that is impaired

- Drinking Water Supply

#### Standards that apply

- Missouri's Water Quality Standards 10 CSR 20-7.031, Table A, allows a maximum of three micrograms per liter ( $\mu\text{g/L}$ ) of atrazine. Because this number is based on health risk associated with a 70 year exposure period, the three  $\mu\text{g/L}$  is interpreted as a long term average.
- A federal health advisory level of one microgram per liter ( $\mu\text{g/L}$ ) of cyanazine is recommended for drinking water supplies.

### Background Information and Water Quality Data

The Edina Reservoir is 51 acres in size and at one time served as the sole public water supply source for about 1,300 people in Edina and 3,000 people served by Knox County Public Water Supply District No.1. Runoff from corn and sorghum production areas in the watershed has resulted in measurable amounts of atrazine and cyanazine being detected within the lake.

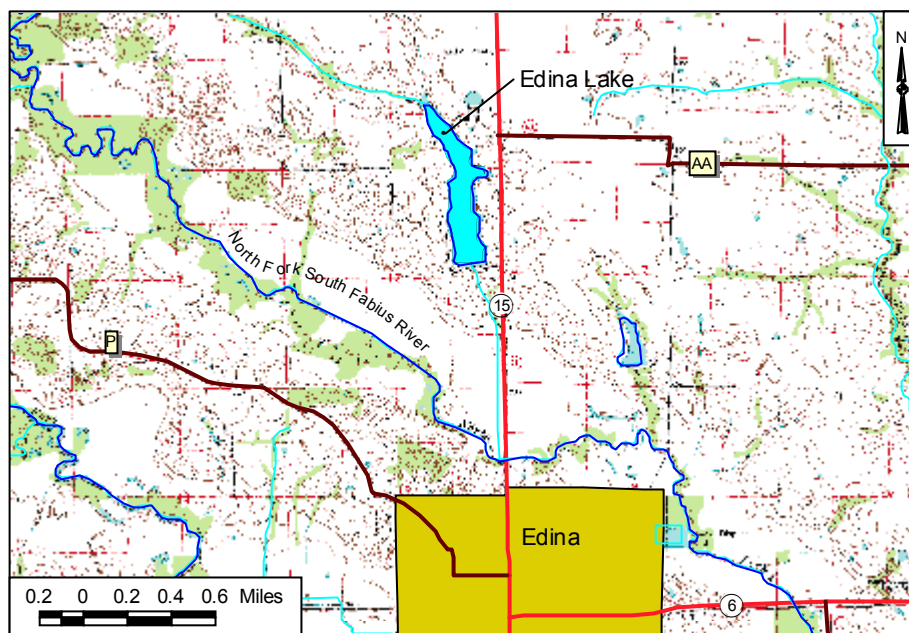

Atrazine is a widely used herbicide for control of broadleaf weeds. It is the most heavily used herbicide to kill weeds in corn and grain sorghum in Missouri. Atrazine is considered a possible

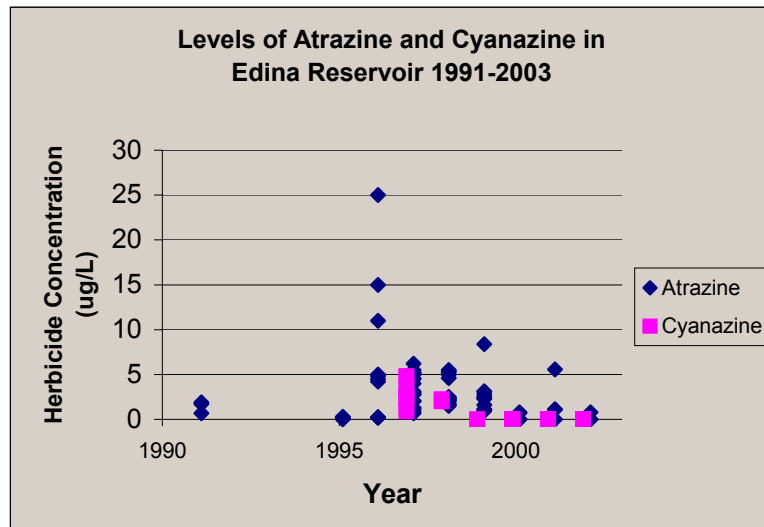

human carcinogen, so the state standard for allowable amounts in drinking water supply source waters is set at three  $\mu\text{g/L}$  or parts per billion.

Cyanazine is an agricultural herbicide that was used from 1971 to 1999, when its manufacturer voluntarily withdrew it from production. At one time it was the fourth most widely used synthetic chemical pesticide in U.S. agriculture, applied to corn, cotton, and sorghum crops to control broadleaf weeds. It is relatively persistent in the environment, and under certain conditions will remain at significant levels in surface water for over one year. It has been identified as a surface water contaminant in 30 states, including Missouri. Cyanazine was withdrawn from use after being linked to a range of adverse health effects, including respiratory distress, cerebral palsy and impaired fetal development.

The current long term average herbicide levels in the lake are  $2.91 \mu\text{g/L}$  for Atrazine and  $1.18 \mu\text{g/L}$  for Cyanazine. Edina Lake is no longer used as a drinking water supply and monitoring of the lake for herbicides has been discontinued.
